

Henry Ford HFCI Lung Cancer Sequencing Panel

The Henry Ford HFCI Lung Sequencing Cancer Panel provides integrated DNA and RNA analysis of a wide range of known oncogenes and tumor suppressor genes for navigating lung cancer care. The genes and types of variant analysis were carefully selected to include content cited by professional organizations such as the National Comprehensive Cancer Network (NCCN) and the European Society for Medical Oncology (ESMO). This test is used for diagnostic, prognostic, and predictive purposes.

Testing Method and Background

This panel test utilizes **Next Generation Sequencing (NGS) technology** to **simultaneously** interrogate multiple target genes associated with lung cancer tumors. This assay utilizes tumor-only workflow with low quantity of input DNA and RNA (40 ng) and accurate detection of variants down to 4% mutant allele frequency from low-quality formalin fixed paraffin-embedded (FFPE) tissue blocks. Target capture probes enrich for full coding sequences of the genes to identify single nucleotide variants (SNVs), small insertions/deletions, gene fusions, gene amplifications and other copy number variants (CNVs). The report includes information about clinically relevant biomarkers and genomic alterations to **help match patients to approved targeted therapies, immunotherapies, and consideration for enrollment in clinical trials.**

Highlights of the Henry Ford HFCI Lung Cancer Panel (12 genes)

Genes Targeted

Fusions / Splicing: ALK, BRAF, EGFR, ERBB2, MET, NTRK1, NTRK2, NTRK3, RET, ROS1

SNVs / Indels: ALK, BRAF, EGFR, ERBB2, KRAS, MET, NRAS, RET, ROS1

Amplifications / CNVs: ALK, BRAF, EGFR, ERBB2, KRAS, MET, NRAS, RET

- **Wide-ranging Coverage of Cancer-Related Variants**
Assessment of oncogenic gene fusions, single-nucleotide variants, splice variants, insertions/deletions and amplifications in one assay using DNA and RNA
- **Accurate Results from Low-Quality Samples**
Sensitive variant detection with as little as 40 ng of input DNA and RNA, and as low as 5% mutant allele frequency, maximizes the results from low input sample types such as formalin fixed, paraffin embedded (FFPE) sections
- **Integrated, Streamlined Workflow**
DNA and RNA are prepared in parallel with an integrated workflow following DNA shearing/cDNA synthesis

Ordering Information

Get started (non-HFHS): Print a Solid Tumor test requisition form online at www.HenryFord.com/HFCPD

Get started (HFHS): Order through Epic using test "HFCI Lung Cancer Sequencing Panel" (MOL8027)

Specimen requirements: The presence of adequate tumor materials submitted for analysis should be confirmed by a surgical pathologist. Sections should be confirmed to contain >50% tumor. If the submitted material for analysis contains <50% of tumor, areas of predominant tumor will be micro-dissected to enrich for neoplastic cells, if possible.

- Formalin-fixed, paraffin-embedded tissue, preferably no older than 2 years
- 5-6 tissue sections at 5-6 micron thickness (please include H&E slide and a copy of pathology report)
- Cytology slides (cell block with 500+ tumor cells, submit block or 5-6 tissue sections at 5-10 micron thickness depending on cellularity)

TAT: 5-10 business days

CPT Codes: 81445, G0452 (88363 or 88381 may apply)

Mail test material to:
Henry Ford Center for Precision Diagnostics
Pathology and Laboratory Medicine
Clinic Building, K6, Core Lab, E-655
2799 W. Grand Blvd., Detroit, MI 48202

Contact us: Client Services, Account and Billing Set-up, and connect with a Molecular Pathologist at (313) 916-4DNA (4362)
